Under Contract No. DAMD17-96-C-6007

June 1997

Introduction

The avoidance of harmful effects, especially long term effects (cancers, mutations, reproductive disorders, etc.) is one of the dominant concerns for nonlethal weapons generally, and RFR technologies specifically. The need for the participation of policy, legal, and medical organizations at all stages of the research means that familiarity with the scientific basis for the potential occurrence of these effects is critical. All of these organizations recognize that the first step in this assessment is a review of the literature.

In order to provide some guidance in this area, a summary of existing, reviewed literature was made. Several comprehensive reviews of the RFR biological effects research have been conducted in the past two years and these reviews provided the basis for this analysis. Our objective is not to make a scholarly assessment of the research, but to analyze trends in the data, as reported.

The approach taken is as follows. Each citation summarized in References 1, 2, and 3 were entered into an MS Access database. Since many of the citations are duplicated between these reviews, each citation in Reference 2 and 3 was cross-checked for uniqueness before entering. Approximately 300 unique citations were found.

For each citation a number of data points were determine; a data point is an exposure condition (frequency, type of modulation, intensity, and duration), species, and biological effect observed. When a range of values was reported, the high and low extremes were entered. When the citations were quoted in more than one reference, the data reported was cross-checked. If the data was in disagreement between the summaries, the original paper was consulted to resolve the difference. This process produced over 700 data points.

To make the characterization of the data reported more ameniable to trend analyses, each non-numeric database field was assigned a category. The categories are as follows.

Species Type

1. Molecules
2. Cells
3. Organs
4. Embryos
5. Insects
6. Small animals
7. Large animal

Wave Modulation Type

1. Amplitude modulated (AM)
2. Continuous modulation (CM)
3. Pulse modulation (PM)
4. Sine modulation (SM)
5. Frequency modulated (FM)

Biological Effect Category

1. Behavior
2. Biochemical
3. Cardiac
4. Genetic
5. Growth
6. Health
7. Hematoligic
8. Immunologic
9. Life span
10. Metabolic
11. Molecular
12. Nervous system
13. Neuroendocrine
14. Senses
15. Teratogenesis
16. Testes

Effect Level

0. None
1. Minor
2. Severe
3. Long term

Examples of Long Term Effects Include

1. decreased postnatal survival
2. teratogenesis
3. maternal lethality, decreased fetal weight
4. increased lethality to endotoxin
5. higher mutagencity index
6. lethality

Analyses were made using JAYCOR's SCATT program for finding graphical trends in categorized data. The program is provided as part of the project deliverables along with the MS Access database.

The figures show plots made of the observed effect level vs. species and SAR for small animals and large animals. Of particular interest is the occurrence of long term effects. In each figure, the species are distributed along the horizontal axis with the legend explaining the species number. The SAR values are plotted in the vertical. For each species there are four vertical scattering of data points, one for each effect level, slightly displaced in the horizontal so the individual data can be seen. The conditions associated with long term effects are plotted as filled symbols.

As can be seen, most of the data has been taken in rodent species: rats and mice. All data with SAR > 50 W/kg show some effect. The range of SAR values for a given level is broad and overlaps other levels—in other words, there are no clear threshold of effects based on this mass of data. Such trends may be revealed if the data were further analyzed by effect category, that is, if trends were looked for in only the behavior data. Such analyses can be conducted by the user with SCATT.

Our interest here is in the occurrence of long term effects. For the rabbit and rat, the first observation of long term effects occurs for a SAR ≈ 30 W/kg, which suggests a threshold. The amount of data is too sparse for such a value to have statistical significance. For the mouse, however, long term effects (higher mutagencity index) are seen at very small values (0.5 W/kg). The lower threshold in a lower body weight animal species may be a trend.

The second figure presents the same format of data, but for larger animal species. The first observation is that the number of data points is much smaller—not unexpected given the animal's size, lifetime, and metabolic rate which make such experiments more difficult. Even though the SAR values are as large as 60 W/kg, no effects above minor, let alone long term, are observed! Again, although the number of data points is so few that statistical significance is low, the implication is intriguing.

While the analysis of these data should be pursued at greater depth (the database will point the reader to the appropriate citations where more information can be obtained), a hypothesis immediately comes to mind. The animal that shows the most significant long term effects below a SAR of 30 W/kg is the mouse, which has the smallest body mass by far. **Therefore, the possibility exists that the SAR is not the correct scaling law between species.** If this hypothesis were confirmed, then the interpretation of existing data might yield a much higher threshold for long term effects and thereby reduce the implied hazard of RFR devices.

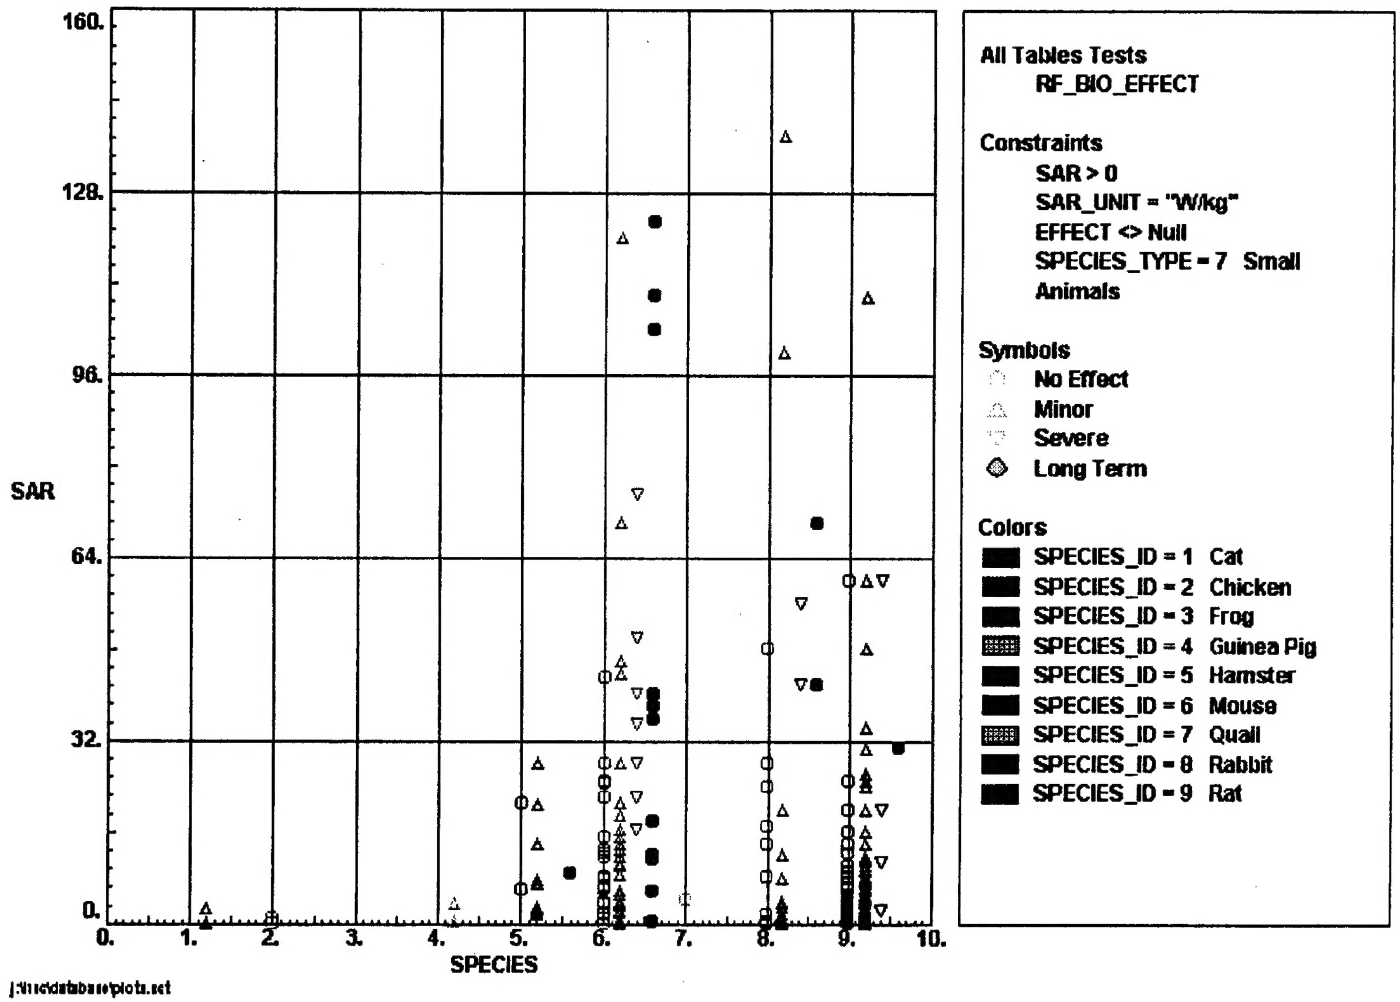

Figure 1. Small animal effects.

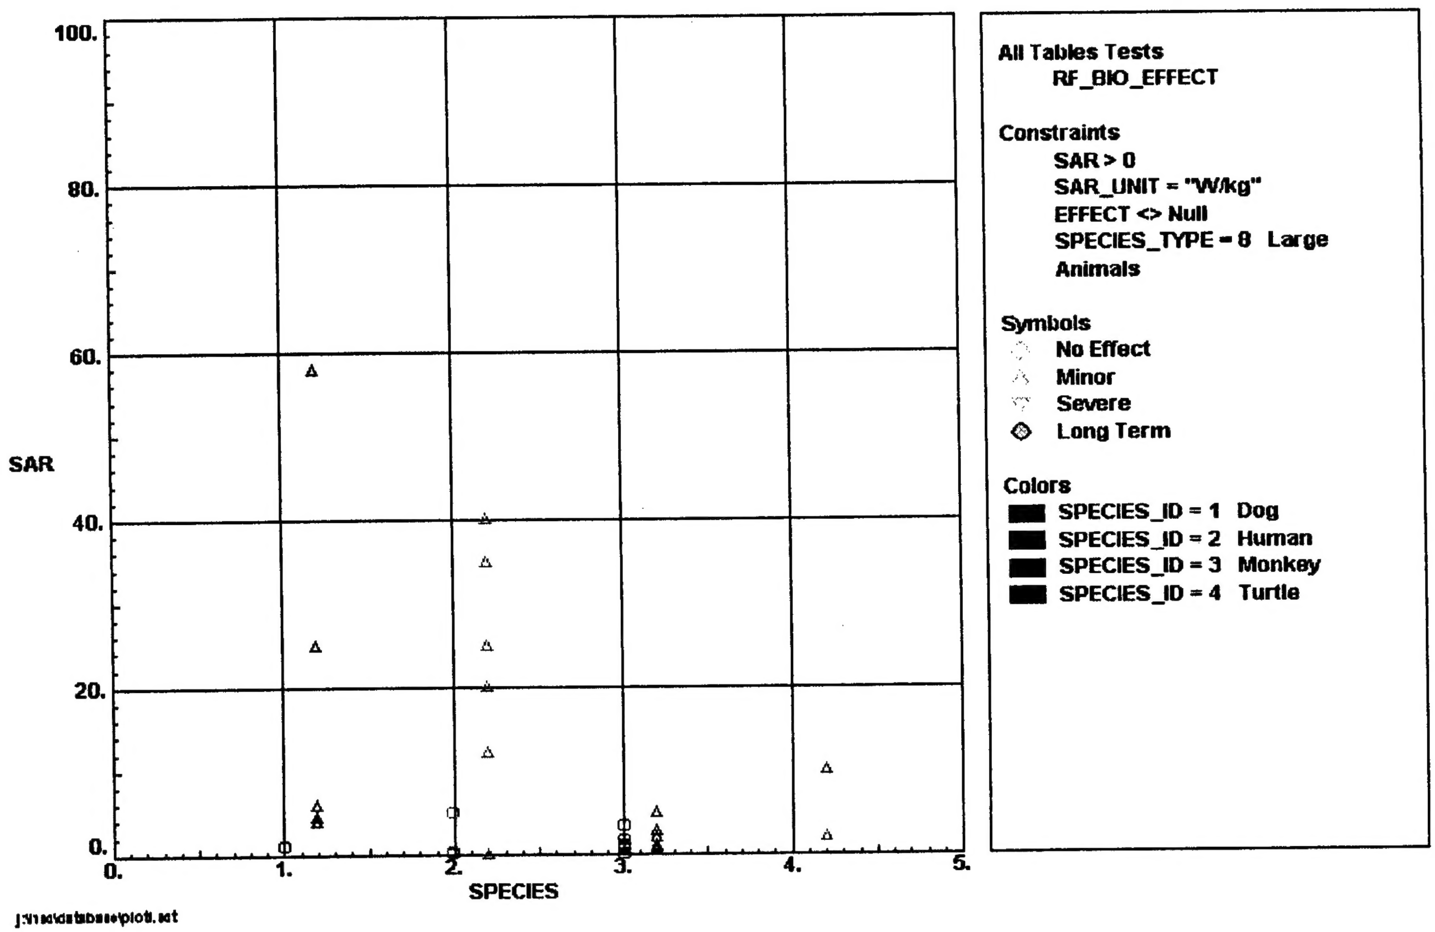

Figure 2. Large animal effects

Conclusions

The brief analysis of the RFR literature raised a question about the validity of SAR as a means of scaling data between species, especially from the very small mass species. Since many of the research items listed above are expressed in terms of effective dose, like SAR, resolving this matter is at the heart of the credibility of the results for any particular system.

Analysis of RFR Biological Effects

(Presentation format)

Bioeffects Review

2997-04/6-97

- **Issues**
  - Avoidance of all harmful effects
  - Participation of policy, legal, medical, etc. at each stage of research
  - Decision makers unfamiliar with scientific results
- **Objective**
  - Summarize existing, reviewed literature
  - Present trends of effects of concern
- **Approach**
  - Analysis limited to RFR and microwaves
  - Literature summaries placed in ACCESS database
  - Parameters and effects divided into categories
  - Cross trends sought with JAYCOR's SCATT program

JAYCOR
Simulation, Engineering & Testing

RFR Bioeffect Database

2997-04/6-97

- **700+ data points from the following reviews**
  - Handbook of Biological Effects of Electromagnetic Fields, 2nd Edition. C. Polk and E. Postow. CRC Press. (1996)

Summary of Bioeffects

2997-04/6-97

- **Occurrence of long term effects are a concern of NLT**
  - A potential show stopper for any NLT
  - Particular concern for EMF devices
  - Requires considerable time and effort to resolve
- **Results for the limited literature reviewed**
  - The smallest animals show long term effects at very low SAR
  - Rabbits and rats may have a threshold SAR $\approx$ 30 W/kg
  - Large animal tests have revealed no long term effects
- **Research is needed to determine**
  - If small animal models are inappropriate
  - If enough large animal tests have been conducted

DEFINITION OF FIELDS

DEFINITION OF FIELDS

SPECIES	Species or experimental system	
SPECIES_TYPE	Species categories:	1 = Molecules, 2 = Cells, 3 = Organ, 5 = Embryo, 6 = insect, 7 = Small Animals, 8 = Large Animals
FREQUENCY	Frequency electromagnetic waves in GHz	
TYPE	Wave modulation:	1 = Amplitude Modulation (AM); 2 = Continue Modulation (CM); 3 = Pulse Modulation (PM); 4 = Sine-Wave Modulation (SM); 5 = Frequency Modulation (FM)
INTENSITY	Intensity of electromagnetic waves	
INTENSITY_UNIT	Units of Intensity	(W/m/m, kVpp/m, Vnm/m, V/m, W, or Vrms/m)
SAR	Specific Absorption Rate	
SAR_UNIT	Units of SAR	(W/kg, W/m/m, W/l, or J/min)
DAYS	Number of days exposed to electromagnetic waves	
MINUTES	Number of minutes of each day exposed to electromagnetic waves	
EFFECT	0 = Not Effects, 1 = Minor Effects, 2 = Severe Effects, 3 = Long Term Effects	
EFFECT_DESCRIPTION	Description of effects	
REFERENCE_INDEX	Reference index	
CATEGORY	Categories of studies:	1 = Behavior, 2 = Biochemical, 3 = Cardiac, 4 = Genetic, 5 = Growth, 6 = Health, 7 = Hematologic, 8 = Immunologic, 9 = Life Span, 10 = Metabolism, 11 = Molecular, 12 = Nervous, 13 = Neuroendocrine, 14 = Senses, 15 = Teratogenesis, 16 = Testes

576	mouse	0.0266	2	89000	W/m/m	3.6	W/kg	1	20	no effect on growth	5	1537
577	mouse (adult)	2.45	2	8000	V/m			5	40	no significant cyclic-AMP differences among RFR, thermal-control, and cage-control groups	15	2100
578	mouse (pregnant CD-1)	2.45	2	34	W/m/m	2	W/kg	17	100	the mean live fetal weights of the RFR exposed were not significantly different from those of the sham-exposed litters	15	2005
579	mouse (pregnant CD-1)	2.45	2	136	W/m/m	8.1	W/kg	17	100	the mean live fetal weights of the RFR exposed were not significantly different from those of the sham-exposed litters	15	2005
580	mouse (pregnant CD-1)	2.45	2	140	W/m/m	8.3	W/kg	17	100	the mean live fetal weights of the RFR exposed were not significantly different from those of the sham-exposed litters	15	2005
581	mouse (pregnant CD-1)	2.45	2	280	W/m/m	22.2	W/kg	10	100	the mean live fetal weights of the RFR exposed were significantly lower than the sham-exposed litters	15	2005
582	mouse (pregnant CD-1)	2.45	2	280	W/m/m	16.5	W/kg	12	100	RFR-exposed: no significant differences in live, dead, and resorbed fetus count on gesation day 18; ossification of sternal centers delayed; weights of 7-day-old pups were 10% lower.	15	2007
583	mouse (pregnant CD-1)	2.45	2	280	W/m/m	16.5	W/kg	12	100	significantly lower body and brain weights (by 10%) for neonates from RFR-exposed dams; no differences in ability to concentrate urine or in tolerance to ouabain.	15	2010
584	hamster (syrian)	2.45	2	200	W/m/m	6	W/kg	9	100	no significant effect in fetal survival, body weight, skeletal maturity, or incidence of terate. raised rectal temperatures by about 0.4 degree C.	15	2008
585	hamster (syrian)	2.45	2	300	W/m/m	9	W/kg	9	100	significant higher fetal resorptions, lower fetal body weights, and delayed skeletal maturity. raised rectal temperatures by about 1.6 degree C.	15	2008
586	mouse (pregnant CD-1)	2.45	2	50	W/m/m	6.7	W/kg	15	480	differences in numbers of pregnanices, maternal weight gains, and fetal weights for nonhandled-RFR- and sham-exposed dams nonsignificant. the handling was the primary factor in the differences	15	2081
587	mouse (pregnant CD-1)	2.45	2	210	W/m/m	28.1	W/kg	5	480	differences in numbers of pregnanices, maternal weight gains, and fetal weights for nonhandled-RFR- and sham-exposed dams nonsignificant. the handling was the primary factor in the differences	15	2081
588	mouse (pregnant CD-1)	2.45	2	210	W/m/m	28.1	W/kg	10	480	differences in numbers of pregnanices, maternal weight gains, and fetal weights for nonhandled-RFR- and sham-exposed dams nonsignificant. the handling was the primary factor in the differences	15	2081
589	mouse (pregnant CD-1)	2.45	2	300	W/m/m	40.2	W/kg	5	480	the threshold for teratogenic effect is about 300 W/m/m (40.2 W/kg).	15	2081
590	mouse (pregnant CD-1)	2.45	2	300	W/m/m	40.2	W/kg	10	480	the threshold for teratogenic effect is about 300 W/m/m (40.2 W/kg).	15	2081

DATABASE OF RADIOFREQUENCY BIOLOGICAL EFFECTS

ID	Species	Frequency	Type	Intensity	Unit	SAR	Unit	Days	Minutes	Effects	Category	Reference Index
591	mouse (pregnant CD-1)	2.45	2	300	W/m/m	40.2	W/kg	5	480	pregnancy rate of RFR groups was lower than for other groups	15	2082
592	mouse (pregnant CD-1)	2.45	2	300	W/m/m	40.2	W/kg	10	480	fetal weight gains were smaller for the handled-RFR-exposed and handled-heated groups than for the other groups	15	2082
593	mouse (female CD-1)	2.45	2	90	W/m/m	11.7	W/kg	1	180	on gestation day 4, no significant differences were seen between RFR and sham groupsin embryo counts, abnormalities, and developmental stage.	15	2053
594	mouse (female CD-1)	2.45	2	190	W/m/m	24.7	W/kg	1	180	on gestation day 4, no significant differences were seen between RFR and sham groupsin embryo counts, abnormalities, and developmental stage.	15	2053
595	mouse	3	3	80	W/m/m	3.25	W/kg	20	300	histochemical changes in the brains of pups (seen by fluorescence spectrophotometry) were ascribed primarily to postnatal RFR-exposure. no data were presented on the incidences of terata.	15	2021
596	rat (pregnant)	0.02712		55	W			16	10	the major abnormalities seen were neurocranial malformations, kinked or short tails and hand defects, and cleft palate. the highest incidences were for exposure on days 13, and 14	15	2026
597	rat (pregnant)	2.45	2	400	W/m/m	6	W/kg	10	100	differences between RFR and sham groups in counts of live, dead, resorbed fetuses, and total implants were not significant. the weight of live fetuses and number of ossified sternebrae from the RFR groups were significant lower than for the sham groups	15	2009
598	rat (pregnant)	0.02712		1380	W/m/m	11.8	W/kg	8	30	on day 20, significantly higher effects were seen in RFR groups than in sham groups and cage controls treated on corresponding days, with highest embryotoxicity for exposure on day 9. the teratogenic effects were clearly thermal.	15	2067
599	rat (pregnant)	0.02712		1380	W/m/m	11.8	W/kg	1	56.5	the severity of the teratogenic effect increased with colonic temperature and duration of maintenance ataeach temperature.	15	2068
600	rat (pregnant)	0.1	2	250	W/m/m	0.4	W/kg	6	400	no significant differences were seen between RFR-exposed and sham-exposed groups in any of tabulated teratogenic endpoints. only 64% of live fetuses from the RFR group had skeletal variations vs 76% from the sham group.	15	2069
601	rat (pregnant)	0.02712	2	1380	W/m/m	10.8	W/kg	1	25	the exposures were terminated when colonic-temperature reached 41.0, 41.5, 42.0, 42.5, or 43.0 degree C. the results indicated the existence of a colonic temperature threshold of 41.5 degree C for birth defects and prenatal death.	15	2070
602	rat (female)	2.45		100	W/m/m	1.76	W/kg	18	180	no significant difference in malformation.	15	2054
603	rat (infant)	2.45		1200	W/m/m	12.48	W/kg	39	180	the RFR and sham pups at correspondings ages in brain weights, cerebral dimensions, histologic endpoints, and the purkinje-cell counts in the corresponding cerebrilar lobules were all not significant differences.	15	2054

DATABASE OF RADIOFREQUENCY BIOLOGICAL EFFECTS

ID	Species	Frequency	Type	Intensity	Unit	SAR	Unit	Days	Minutes	Effects	Category	Reference Index
604	rat (pregnant)	0.02712		1	W/m/m	0.0001	W/kg	20	1440	no dead fetuses were found. the RFR effect of resorptions occurs during the early stage of egg development. mean litter weight of RFR-exposed was significantly lower than sham groups	15	2104
605	rat (pregnant)	0.02712		5	W	2.8	W/kg	1	60	with the erbe unit, the numbers of live embryos rose and the resorptions fell with increasing RFR level, whereas opposite trends were observed with the enraf unit. no significant differences were seen in mean embroy weight.	15	2013
606	rat (pregnant)	0.02712		10	W	4.2	W/kg	1	45	with the erbe unit, the numbers of live embryos rose and the resorptions fell with increasing RFR level, whereas opposite trends were observed with the enraf unit. no significant differences were seen in mean embroy weight.	15	2013
607	rat (pregnant)	0.02712		15	W	5.6	W/kg	1	30	with the erbe unit, the numbers of live embryos rose and the resorptions fell with increasing RFR level, whereas opposite trends were observed with the enraf unit. the only one of 86 embryo exhibited abnormalities.	15	2013
608	rat (pregnant)	0.02712	3	33000	V/m	11.2	W/kg			core temperatures raised by 2.5 degree C and held for 50 or 60 min. yielded resorption rates higher than for the controls (4%), but yielded no abnormal fetuses. the severity of teratogic effects rose with the larger core-temperature increments	15	2014
609	rat (virgin)	0.02712		450	V/m			25	60	no teratogenic effects were found, but fewer RFR-exposed rats had mated and fewer of those became pregnant	15	2015
610	rat (pregnant)	0.915		100	W/m/m	4	W/kg	20	360	on gestation day 22, no significant differences were seen between the RFR and sham groups in weights of maternal brain, liver, kidneys, or ovaries, or in litter sizes or fetal weights	15	2056
611	rat (pregnant)	0.915		100	W/m/m	4	W/kg	20	360	the weights of RFR-exposed pups of the first dam breeding were significantly higher than of sham-exposed pups, but no significant teratogenic effects were seen in those pups	15	2057
612	rat (pregnant)	2.45		200	W/m/m	3.6	W/kg	20	360	on gestation day 22, no differences were seen between RFR-exposed and sham-exposed dams in any of the dam endpoints, and no terata were evident in the fetuses.	15	2058
613	rat (pregnant)	2.45		200	W/m/m	5.2	W/kg	20	360	on gestation day 22, no differences were seen between RFR-exposed and sham-exposed dams in any of the dam endpoints, and no terata were evident in the fetuses.	15	2058
614	rat (pregnant)	6		350	W/m/m	7.28	W/kg	20	360	no teratogenic effects were seen, but the mean fetal weight at term was significantly lower for the RFR group than the sham group. the latter efect may not have been RFR-related because of fetal-weight differences among control groups.	15	2060
615	rat (pregnant)	6		350	W/m/m	7.28	W/kg	20	360	the mean weight gain of RFR-exposed dams was significantly lower for the sham-exposed dams, but there were also comparable differences among control groups.	15	2061

REMARKS

REMARKS OF DATA BASE OF RADIOFREQUENCY BIOLOGICAL EFFECTS

ID	REMARKS
188	this was primarily a study of mother-infant behavior, and of EEGs. because of autolsis, the cause of the infant deaths could not be determined. this was also reported in table 15I in source #2 (reference #64)
193	this was also reported in table 15A of source #2. In source #2, the SAR was not determined and the intensity were in different units. the mice were 4-day-old and test up to age 21 days. duration and duty cycle of pulse power were not stated
194	this was also reported in table 15A of source #2. In source #2, the SAR was not determined and the intensity were in different units the mice were 4-day-old and test up to age 21 days. duration and duty cycle of pulse power were not stated
195	this was also reported in table 15A of source #2. In source #2, the SAR was not determined and the intensity were in different units the mice were 4-day-old and test up to age 21 days; the power were 8 kV/m and 55 A/m and the two field were parallel (vertical) in coincident planes
205	this was reported in table 9 chapter 11 of source #1 (reference #150). in source #1, the SAR were 85-112 W/kg and no intensity data
206	this was reported in table 9 chapter 11 of source #1 (reference #150). in source #1, the SAR were 85-112 W/kg and no intensity data
207	this was reported in table 9 chapter 11 of source #1 (reference #151). in source #1, the SAR were 85-112 W/kg and no intensity data
208	this was reported in table 9 chapter 11 of source #1 (reference #151). in source #1, the SAR were 85-112 W/kg and no intensity data
209	this was reported in table 15A of source #2 (reference #19).
210	this was also report in table 15D of source #2 (reference #20). effects were clearly thermal, but validity of the findings may be questioned because of the small numbers of rats studies (recognized by the authors), which necessitated averaging the data in each group over the 10- to 17-day gestation period.
212	this was reported in table 8b of source #2 (reference #45)
218	this was also report in table 15D of source #2 (reference #97). this study was primarily on seeking immunologic and hematologic effects. the SAR range was 4.7 - 0.7 W/kg, represented the decrease of mean SAR with increase in mean weight (with age) rather than variation among animals at any time. the paper also reported the immunologic, hematologic, and teratogentic effects
219	this was also report in table 15D of source #2 (reference #6).
225	this was also report in table 15D of source #2 (reference #95). source #2 was indicated that the SAR was not determined in paper. selected one pup from each litter on past-partum days 2 - 15 to determine body and brain weights.
556	the results are difficult to analyze because of the large spatial range of RFR levels and the likelihood of larger internal temperature gradients than within sham-exosed eggs (clarke and Justesen, 1983)
557	this study suffers from faulty expserimental-design and methodology; little if any credence can be given to its positive or negative findings
558	this study suffers from faulty expserimental-design and methodology; little if any credence can be given to its positive or negative findings
559	inadequate control of the temperatures during RFR-exposure and the spatial gradient within the exposure chamber are major flaws in an otherwise well designed study
560	inadequate control of the temperatures during RFR-exposure and the spatial gradient within the exposure chamber are major flaws in an otherwise well designed study
561	inadequate control of the temperatures during RFR-exposure and the spatial gradient within the exposure chamber are major flaws in an otherwise well designed study

REMARKS OF DATA BASE OF RADIOFREQUENCY BIOLOGICAL EFFECTS

ID	REMARKS
562	in the absence of information on exposure methodology or dosimetry, as well as other details about spatial ambient-temperature uniformity within the exposure chamber, egg-turning arrangement and scheduling, and the like, little credence can be given to any findings of this study
563	in the absence of information on exposure methodology or dosimetry, as well as other details about spatial ambient-temperature uniformity within the exposure chamber, egg-turning arrangement and scheduling, and the like, little credence can be given to any findings of this study
564	in the absence of information on exposure methodology or dosimetry, as well as other details about spatial ambient-temperature uniformity within the exposure chamber, egg-turning arrangement and scheduling, and the like, little credence can be given to any findings of this study
565	in the absence of information on exposure methodology or dosimetry, as well as other details about spatial ambient-temperature uniformity within the exposure chamber, egg-turning arrangement and scheduling, and the like, little credence can be given to any findings of this study
566	in the absence of information on exposure methodology or dosimetry, as well as other details about spatial ambient-temperature uniformity within the exposure chamber, egg-turning arrangement and scheduling, and the like, little credence can be given to any findings of this study
567	in the absence of information on exposure methodology or dosimetry, as well as other details about spatial ambient-temperature uniformity within the exposure chamber, egg-turning arrangement and scheduling, and the like, little credence can be given to any findings of this study
572	power is 59.5 and 2.12 w/cm2
573	power is 29.8 and 1.06 W/cm2
574	power is 59.5 and 2.12 w/cm2
575	power is 29.8 and 1.06 W/cm2
576	this was also reported in table 15A of source #2. In source #2, the SAR was not determined and the intensity were in different units the mice were 4-day-old and test up to age 21 days. duration and duty cycle of pulse power were not stated
577	brain assays were done after brain-enzyme inactivation with high-intensity RFR of short (300 msec) duration.
578	10 of 103 RFR-exposed litters had 1 or more abnormal fetuses versus 2 of 117 sham-exposed litters. the validity of the statistical treatment was questioned.
579	7 of 109 RFR-exposed litters had 1 or more abnormal fetuses versus 7 of 106 sham-exposed litters. the validity of the statistical treatment was questioned.
580	5 of 62 RFR-exposed litters had 1 or more abnormal fetuses versus 1 of 73 sham-exposed litters. the validity of the statistical treatment was questioned.
581	5 of 44 RFR-exposed litters had 1 or more abnormal fetuses versus 2 of 40 sham-exposed litters. the validity of the statistical treatment was questioned.
582	5 of 44 RFR-exposed litters had 1 or more abnormal fetuses versus 2 of 40 sham-exposed litters. the validity of the statistical treatment was questioned.
583	5 of 44 RFR-exposed litters had 1 or more abnormal fetuses versus 2 of 40 sham-exposed litters. the validity of the statistical treatment was questioned.
584	comment by authors: hamster fetus may be more susceptible to RFR than the mouse.
585	comment by authors: hamster fetus may be more susceptible to RFR than the mouse.
588	the rectal temperature was raised about 1.0 degree C. the handling was an important factor, but heating was as well.
589	the rectal temperature was raised about 2.3 degree C.

REMARKS OF DATA BASE OF RADIOFREQUENCY BIOLOGICAL EFFECTS

ID	REMARKS
590	the rectal temperature was raised about 2.3 degree C.
593	the negative results were consonant with the approximately 300 W/m/m threshold found by Nawrot ett al. (1981). rectal temperature rises was 0.0 degree C
594	the negative results were consonant with the approximately 300 W/m/m threshold found by Nawrot ett al. (1981). rectal temperature rises was 1.0 degree C
595	the half pups of RFR-exposed pregnant mice were exposed to RFR (rr group), the other half were sham-exposed (rc group). the half pups of sham-exposed pregnant mice were exposed to RFR (cr group), and the other half were sham-exposed (cc group)
596	they correlated with rectal temperature, showing that the effects were due to heating by RFR. in a separate experiment, heating of tumors to 42 degree C with 461 MHz RFR was found to lower the DNA-synthesis rate more effectively than tumor treatment with X-rays.
598	the SAR range was 11.1 - 12.5 W/kg. the power were 27.12 MHz concurrent CW manetic and electric fields at 55 A/m and 300 V/m in a near-field synthesizer at 23 degree C ambient temperature and 45% relative humidity.
599	treated on gestation day 9, treament groups were: 1) 14 - 22 min. to attain colonic temperature 41.0 degree C, 2) held at 41 degree C for additational 2 hours, 3) 13 - 33 min. to reach 42.0 degree C, 4) held at 42.0 degree C for additional 15.0 min.
600	endpoints inclued colonic-temperature, number of litters, mean implantations per litter, percentages of dead or resorbed implantations or percentages of live fetuses with major skeletal abnormalities, fetal mean weight, crown-rump length, and sex ratio
601	treated on gestation day 9. the power were 27.12 MHz concurrent CW manetic and electric fields at 55 A/m and 300 V/m.
603	brain SARs for the pups mostly decreased with age; the mean value were: 13.95 W/kg in 2-day-old (~10.0 g) pups, 19.18 W/kg in 15-day-old (~30.0 g) pups, 10.05 W/kg in 20-day-old (~50.0 g) pups, 9.72 W/kg in 30-day-old (~100.0 g) pups, and 9.52 W/kg in 40-day-old (~160.0 g) pups,
604	power: 27.12 MHz RFR at field strengths 20 V/m and 0.05 A/m.
605	the SARs were determined with saline phantoms. not clear is why the two diathermy units yielded such differences with the same applicatior. the finding were questionable, especially because with the erbr, only 1 of 86 embryos exposed for 30 min. and none of 49 of embryos exposed for 45 min or 39 embryos for 60 min. exhibited abnormalities. the presence of uncontrolled non-RFR factors was likely.
606	the SARs were determined with saline phantoms. not clear is why the two diathermy units yielded such differences with the same applicatior. the finding were questionable, especially because with the erbr, only 1 of 86 embryos exposed for 30 min. and none of 49 of embryos exposed for 45 min or 39 embryos for 60 min. exhibited abnormalities. the presence of uncontrolled non-RFR factors was likely.
607	the SARs were determined with saline phantoms. not clear is why the two diathermy units yielded such differences with the same applicatior. the finding were questionable, especially because with the erbr, only 1 of 86 embryos exposed for 30 min. and none of 49 of embryos exposed for 45 min or 39 embryos for 60 min. exhibited abnormalities. the presence of uncontrolled non-RFR factors was likely.
608	power: 33.0 kV/m and 0.8 A/m. Durations chosen to raise and hold core temperatures by 2.5, 3.0, 3.5, 4.0, 4.5, or 5.0 degree C.
609	power: 450 V/m and 0.1 A/m. in the absence data, it is difficult to ascribe the differences seen in breeding behavior and pregnancy outcome to the RFR without independent verification.
610	this was also reported in table 9 of source #1 (reference #166). no days and minutes reported in source #1, different intensity and SAR values were repoeted in source #1.
611	this was a companion study to Jensh et al. (1982a), directed primarily toward seeking behavioral effects.
612	the endpoints: mean maternal weight gain during pregnancy, term maternal organ weights (brain, liver, kidneys, ovaries), term fetal weight, resorption rate, and abnormality rate.

REMARKS OF DATA BASE OF RADIOFREQUENCY BIOLOGICAL EFFECTS

ID	REMARKS
613	the endpoints: mean maternal weight gain during pregnancy, term maternal organ weights (brain, liver, kidneys, ovaries), term fetal weight, resorption rate, and abnormality rate.
614	teratogenic effects at 6 GHz may not be expected, because the penetration depth in muscle (0.7 cm) is much smaller than at 24.5 GHz (1.7 cm) or 915 MHz (2.4 cm), so local SARs in the uteri may have been much lower than at 6 GHz even though the whole-body SARs were much higher than in the earlier studies.
615	this was a companion study to Jensh (1984a), directed primarily toward seeking immunologic effects.
616	power absorption was determined from measurements of forward, reflected, and transmitted powers without and with the rat present.
